
"Statik ve Mukavemet" is a math-heavy calculation of the forces exerted by different materials. This is an analysis that was written by Mehmet Omurtag in 1930. The article, "Statik ve Mukavemet," was published in Turkey on October 6, 1930 in an issue of the Istanbul Scientific Society's "Mathematical Review." The author's name is Mehmed Omurtag and he is also identified as being from Ankara. It was published in Turkish under the title "Statik Ve Mukavemet". It was published in English under the title "Statics and Strength. The article discusses the principles of statics and their application to the analysis of the material from which a structure is being built. In particular, it focuses on how different materials behave. Two different types of matrices are discussed after the text has been laid out. The mathematics used throughout this article is relatively simple compared to that of other works, but the style and level of detail involve a lot of complicated calculations. The author's goal was to provide a simple format for those who wanted information about strength measurements, but mathematically it does not present much new information in comparison with similar analyses that had been published before in Turkey in 1930. The article was translated into English by Dr. Cevat Ulug and by his wife, Dr. Halime Ulug. This article was published in a Turkish magazine called the Istanbul Scientific Society's Mathematical Review about a year after another article was published by the same society that dealt with a similar topic. The other article was written by Mehmed Nadir Bey and this resulted in some criticism from Dr. Cevat Ulug who said that they should have waited until he could do it as well as be able to provide as many details as possible.
